BEA 02-11

GROSS DOMESTIC PRODUCT: FIRST QUARTER 2002 (ADVANCE)

Real gross domestic product -- the output of goods and services produced by labor and property located in the United States -- increased at an annual rate of 5.8 percent in the first quarter of 2002, according to advance estimates released by the Bureau of Economic Analysis. In the fourth quarter, real GDP increased 1.7 percent.

The Bureau emphasized that the first-quarter "advance" estimates are based on source data that are incomplete or subject to further revision by the source agency (see the box on page 3). The first-quarter "preliminary" estimates, based on more comprehensive data, will be released on May 24, 2002.

The major contributors to the increase in real GDP in the first quarter were: Private inventory investment, personal consumption expenditures (PCE), government spending, residential fixed investment, and exports. The contributions of these components were partly offset by a decrease in nonresidential structures. Imports, which are a subtraction in the calculation of GDP, increased.

The acceleration in real GDP growth in the first quarter primarily reflected upturns in private inventory investment, in exports, and in residential fixed investment and smaller decreases in nonresidential structures and in equipment and software that were partly offset by a deceleration in PCE. There was a sharp upturn in imports in the first quarter.

NOTE--Quarterly estimates are expressed at seasonally adjusted annual rates, unless otherwise specified. Quarter-to-quarter dollar changes are differences between these published estimates. Percent changes are calculated from unrounded data and annualized. "Real" estimates are in chained (1996) dollars. Price indexes are chain-type measures.

The price index for gross domestic purchases, which measures prices paid by U.S. residents, increased 0.7 percent in the first quarter, compared with an increase of 0.5 percent in the fourth. Excluding food and energy prices, the price index for gross domestic purchases increased 0.9 percent in the first quarter, compared with an increase of 2.0 percent in the fourth. About 0.3 percentage point of the first-quarter increase in the index was accounted for by the pay raise for federal civilian and military personnel, which is treated as an increase in the price of employee services purchased by the federal government. The fourth-quarter increase in the index had reflected the insurance-related price effects associated with the September 11th terrorist attacks; excluding these effects, the index decreased 0.2 percent in the fourth quarter.

Real personal consumption expenditures increased 3.5 percent in the first quarter, compared with an increase of 6.1 percent in the fourth. Durable goods purchases decreased 8.0 percent, in contrast to an increase of 39.4 percent. Nondurable goods increased 8.4 percent, compared with an increase of 2.5 percent. Services expenditures increased 3.8 percent, compared with an increase of 2.0 percent.

Real nonresidential fixed investment decreased 5.7 percent in the first quarter, compared with a decrease of 13.8 percent in the fourth. Nonresidential structures decreased 19.9 percent, compared with a decrease of 33.6 percent. Equipment and software decreased 0.5 percent, compared with a decrease of 5.3 percent. Real residential fixed investment increased 15.7 percent, in contrast to a decrease of 4.6 percent.

Real exports of goods and services increased 6.8 percent in the first quarter, in contrast to a decrease of 10.9 percent in the fourth. Real imports of goods and services increased 15.5 percent, in contrast to a decrease of 7.5 percent.

Real federal government consumption expenditures and gross investment increased 12.4 percent in the first quarter, compared with an increase of 11.4 percent in the fourth. National defense increased 19.6 percent, compared with an increase of 9.0 percent. Nondefense increased 0.2 percent, compared with an increase of 16.0 percent. Real state and local government consumption expenditures and gross investment increased 5.6 percent, compared with an increase of 9.6 percent.

The real change in private inventories added 3.10 percentage points to the first-quarter change in real GDP, after subtracting 2.16 percentage points from the fourth-quarter change. Private businesses reduced inventories \$36.2 billion in the first quarter, following decreases of \$119.3 billion in the fourth quarter and \$61.9 billion in the third.

Real final sales of domestic product -- GDP less change in private inventories -- increased 2.6 percent in the first quarter, compared with an increase of 3.8 percent in the fourth.

Gross domestic purchases

Real gross domestic purchases -- purchases by U.S. residents of goods and services wherever produced -- increased 6.9 percent in the first quarter, compared with an increase of 1.7 percent in the fourth.

Disposition of personal income

Current-dollar personal income increased \$110.7 billion in the first quarter, in contrast to a decrease of \$4.6 billion in the fourth. Personal tax and nontax payments decreased \$87.8 billion, in contrast to an increase of \$137.2 billion.

Disposable personal income increased \$198.5 billion in the first quarter, in contrast to a decrease of \$141.9 billion in the fourth. Real disposable personal income increased 10.5 percent, in contrast to a decrease of 8.1 percent.

Personal outlays increased \$65.7 billion in the first quarter, compared with an increase of \$115.6 billion in the fourth. Personal saving -- disposable personal income less personal outlays -- was \$160.7 billion in the first quarter, compared with \$27.9 billion in the fourth. The personal saving rate -- saving as a percentage of disposable personal income -- increased from 0.4 percent in the fourth quarter to 2.1 percent in the first.

Current-dollar GDP

Current-dollar GDP -- the market value of the nation's output of goods and services -- increased 6.7 percent, or \$168.0 billion, in the first quarter to a level of \$10,431.3 billion. In the fourth quarter, current-dollar GDP increased 1.5 percent, or \$38.4 billion.

Information on the assumptions used for unavailable source data is provided in a technical note that is posted with the news release on BEA's Web site. Within a few days after the release, a detailed "Key Source Data and Assumptions" file is posted on the Web site. In the middle of each month, an analysis of the current quarterly estimates of GDP and related series is made available on the Web site; click on Survey of Current Business, "Business Situation."

BEA's major national, international, regional, and industry estimates; the Survey of Current Business; and BEA news releases are available without charge on BEA's Web site:

Next release -- May 24, 2002, at 8:30 A.M. EDT for:
Gross Domestic Product: First Quarter 2002 (Preliminary)
Corporate Profits: First Quarter 2002

Comparisons of Revisions to GDP

Quarterly estimates of GDP are released on the following schedule: "Advance" estimates, based on source data that are incomplete or subject to further revision by the source agency, are released near the end of the first month after the end of the quarter; as more detailed and more comprehensive data become available, "preliminary" and "final" estimates are released near the end of the second and third months, respectively. The "latest" estimates reflect the results of both annual and comprehensive revisions.

Annual revisions are usually carried out each summer and cover the quarters of the most recent calendar year and of the 2 preceding years. Comprehensive (or benchmark) revisions are carried out at about 5-year intervals and incorporate definitional and classificational changes that update the accounts to portray more accurately the evolving U.S. economy and statistical changes that update the accounts to reflect the introduction of new and improved methodologies and the incorporation of newly available and revised source data.

The table below shows comparisons of the revisions between quarterly percent changes of GDP for the different vintages of the estimates. These comparisons can be used to assess the likely size of future revisions. For example, two-thirds of the revisions between the quarterly change in the advance estimate of real GDP and that in the final estimate were within a range of -0.6 to +0.9 percentage point. Thus, based on past history, the first-quarter change in real GDP now estimated at 5.8 percent at an annual rate, is not likely to be revised below 5.2 percent or above 6.7 percent in the next two releases.

NOTE.—Users are cautioned that particularly for components for which relative prices are changing rapidly, the use of chained-dollar estimates to calculate component shares or component contributions to real growth may be misleading even just a few years from the base year. For accurate estimates of the contributions to percent changes

in real GDP, use table 2.
See "Explanatory Note" at the end of the tables.

Explanatory Note: Measures of Output and Prices

This note describes the calculation of chain-type quantity and price indexes used in the NIPA's.

Changes in current-dollar GDP measure changes in the market value of goods, services, and structures produced in the economy in a particular period. These changes can be decomposed into quantity and price components. Quantities, or "real" measures, and prices are expressed as index numbers with the reference year--at present, the year 1996--equal to 100.

The annual changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent years. (Quarterly changes in quantities and prices are calculated using a Fisher formula that incorporates weights from two adjacent quarters; quarterly indexes are adjusted for consistency to the annual indexes before percent changes are calculated.) For example, the 1999-2000 annual percent change in real GDP uses prices for 1999 and 2000 as weights, and the 1999-2000 annual percent change in GDP prices uses quantities for 1999 and 2000 as weights. These annual changes are "chained" (multiplied) together to form time series of quantity and price indexes. The Fisher formula also produces percent changes in quantities and prices that are not affected by the choice of reference years. In addition, because the changes in quantities and prices calculated in this way are symmetric, in general, the product of a quantity index and the corresponding price index equals the current-dollar index. (BEA also publishes a measure of the price level known as the "implicit price deflator (IPD)," which is calculated as the ratio of current-dollar value to the corresponding chained-dollar value, multiplied by 100. The values of the IPD are very close to the values of the corresponding "chain-type" price index for all periods.)

Chain-type quantity and price indexes for GDP and its major components are presented in this release as index numbers in table 5 and in the form of percentage changes from the preceding period in tables 1, 4, 6A, and 6B. Contributions by major components to changes in real GDP are presented in table 2. BEA also prepares measures of real GDP and its components in a dollar-denominated form, designated "chained (1996) dollar estimates." For GDP and most other series, these estimates, which are presented in table 3, are computed by multiplying the 1996 current-dollar value by a corresponding quantity index number and then dividing by 100. For example, if a current-dollar GDP component equaled \$100 in 1996 and if real output for this component increased 10 percent in 1997, then the chained (1996) dollar value of this component in 1997 would be \$110 (\$100 x 1.10).

For analyses of changes over time in an aggregate or in a component, the percentage changes calculated from the chained-dollar estimates and from the chain-type quantity indexes are the same; any differences will be small and due to rounding. However, because the relative prices used as weights for any period other than the reference year differ from those used for the reference year, the chained-dollar values for the detailed GDP components will not necessarily sum to the chained-dollar estimate of GDP or to any intermediate aggregate. A measure of the extent of such differences is provided by a "residual" line, which indicates the difference between GDP (or another major aggregate) and the sum of the most detailed components in the table. For periods close to the reference year, when there usually has not been much change in the relative prices that are used as weights for the chain-type index, the residuals tend to be small, and the chained (1996) dollar estimates can be used to approximate the contributions to growth and to aggregate the detailed estimates. As one moves further from the reference year, the residual tends to become larger, and the chained-dollar estimates become less useful for analyses of contributions to growth. Thus, the contributions to percent change shown in table 2 provide a better measure of the composition of GDP growth. In particular, for components for which relative prices are changing rapidly, calculation of contributions using chained-dollar estimates may be misleading even just a few years from the reference year.
